## MANIPULATION OF A MOLECULAR ROTOR BASED ON O-MEO-DMBI

DRESDEN
concept

## O-MEO-DMBI ROTOR

600 Rotation events by applying a voltage pulse at constant current.
Parameters:
$\mathrm{Vb}=[0.4 ; 0.5 ; 0.7 ; 1.0 ; 1.2] \mathrm{V}$
It $=$ [100; 200; 300; 400; 500]pA

## OBSERVED STATES

Complete set with hexagonal symmetry

## OBSERVED STATES

| Initial state: | A |  | Initial state: | B |  | Initial state: | C |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \# observations: | 135 |  | \# observations: | 95 |  | \# observations: | 142 |  |
| Final state | Freq. | $\Delta \theta\left[{ }^{\circ}\right]$ | Final state | Freq. | $\Delta \theta\left[{ }^{\circ}\right]$ | Final state | Freq. | $\Delta \theta\left[{ }^{\circ}\right]$ |
| B | 54.8\% | 62 | C | 67.4\% | 59 | D | 87.3\% | 61 |
| C | 44.4\% | 121 | D | 18.9\% | 120 | E | 9.9\% | 128 |
|  |  |  |  |  |  | H | 0.7\% | 29 |
| 1 | 0.7\% | 36 | H | 10.5\% | 88 | F | 0.7\% | 180 |
|  |  |  | G | 1.1\% | 268 | G | 0.7\% | 209 |
|  |  |  | Indefinite | 2.1\% |  | Indefinite | 0.7\% |  |

In 4 ocassions ( $0.7 \%$ ) the molecule was observed to made a CCW turn in a single step

## TRACKING OF A SWITCHING EVENT

Tracking signals for a switching event $(\mathrm{V}=0.7 \mathrm{~V}, \mathrm{I}=100 \mathrm{pA})$

Events that happened instantaneously ( $t<0.02$ ) were not considered for the statistical analysis. This accounts for 129
observations (21.5\%)

## STATISTICAL ANALYSIS

## Assumption:

$$
\begin{gathered}
f(t)=\lambda e^{-\lambda t} u(t) \\
E[T]=\lambda
\end{gathered}
$$

Goal: Obtain Maximum Likelihood Estimator of $\lambda$

$$
\begin{gathered}
\lambda_{0}=\frac{N}{\sum t_{i}} \\
\operatorname{Var}[\hat{\lambda}]=\frac{\lambda_{0}^{2}}{N}
\end{gathered}
$$

## RESULTS: EFFECT OF INITIAL STATE AND VOLTAGE

Projected threshold at 0.35 V

## RESULTS: EFFECT OF CURRENT

## Variation of the switching rate against the current

Switching yield vs. tunnelling resistance

- $Y(R)$ Logarithmic $(Y(R))$

## CONCLUSIONS

- O-MeO-DMBI makes CW turns, hopping between 6 observed adsorption states—although some exceptional CCW turns occurred. The adsorption states follow the hexagonal symmetry of the $A u(111)$ surface.
- Upon application of a voltage pulse, the molecule stays in its initial state for a short time before hopping to the next state. This residence time varies with the initial state and the applied voltage, but its dependence on the current is rather weak.

## Images: (0.2 V; $20 \mathrm{pA} ; 10 \mathrm{~nm} \times 5 \mathrm{~nm}$ ); 15 K

- starts rotation above 9.5 K
- want to adjust temperature that we see single rotation steps or complete rotation
- not all six orientations seems to be present
- DMBI on $\mathrm{Au}(111)$ - Heating to induce rotation (20 K)

Images: (0.2 V; $100 \mathrm{pA} ; 5 \mathrm{~nm} \times 5 \mathrm{~nm}$ ); 20 K

- full rotation of the left molecule
- other molecules do not fulfill the full rotation
depending on adsorption position
- not all six orientations seems to be present
- DMBI on $\mathrm{Au}(111)$ - Heating to induce rotation (20 K)

Images: (0.2 V; $100 \mathrm{pA} ; 5 \mathrm{~nm} \times 5 \mathrm{~nm}$ ); 20 K

- full rotation of the left molecule
- other molecules do not fulfill the full rotation
depending on adsorption position
- not all six orientations seems to be present
- DMBI on $\mathrm{Au}(111)$ - Heating to induce rotation (20 K)
- molecules with different chiralities imaged at different biases at 20 K (up-right molecule: R-enantiomer; low-left molecule: S-enantiomer)

Images: (100 pA; $7.5 \mathrm{~nm} \times 7.5 \mathrm{~nm}$ ); 20 K

- DMBI on Au(111) - Heating to induce rotation (20 K)

Images: (100 pA; $7.5 \mathrm{~nm} \times 7.5 \mathrm{~nm}$ ); 20 K

- DMBI on $\mathrm{Au}(111)$ - Heating to induce rotation

- Molecules start to rotate at $\sim 9.5 \mathrm{~K}$
- Several preferred orientations, no full rotation: preferred adsorption angles?
- Adsorption individually different
- Fast small (4 nm, 3 s) images show positions, but very fast movement
